Ayodele John Oluwaseyi

Software Engineer · Full-Stack & Mobile · TypeScript · Next.js · Laravel · PostgreSQL · Flutter · React Native

Kampala, Uganda · leojohnseyi@gmail.com · linkedin.com/in/johnoluwaseyi · github.com/johnseyi · johnseyi.github.io

SUMMARY

Software engineer who designs, builds and runs complete production systems, usually as the sole engineer. Since March 2026 I have owned the platform of a German B2B tyre exporter end to end: a Next.js storefront, a Laravel API with Stripe and Adyen payments, 2FA and EU trade documents, an offline-first sales app used by partners in Ghana and Nigeria, and a React Native app the operations team uses. Alongside that, I build mobile and web systems for clients in Nigeria and Uganda, including a Flutter clinical decision-support app for Android and iOS backed by 1,400+ automated tests, and a cinema platform with Mobile Money and tax-authority e-invoicing. A networking and cybersecurity background means failure modes and security are designed in from the start, not patched in later.

WORK EXPERIENCE

Software Engineer, Okelcor GmbH *Mar 2026 – Present*

Munich, Germany (Remote)

- Sole engineer for a B2B tyre exporter serving 40+ countries, replacing quotes and trade documents sent by email and WhatsApp with one platform, spanning a web storefront, a REST API, an Android partner app and a React Native operations app.
- Built a Next.js/TypeScript storefront with a 260+ product catalogue, filtering, Stripe Checkout, quote workflows, live payment milestones and downloadable export documents (okelcor.com).
- Designed the Laravel 13 API from scratch: 178 migrations, Stripe, Adyen, Sanctum, Google 2FA, Pusher, VAT handling, PDF invoices, EU trade declarations and container tracking. One backend serves all three front ends, so business rules are never duplicated.
- Maintain ~1,180 API tests covering partner sync, permissions, login hardening and webhook verification. After launch, fixed a shared-device data-scoping bug within a day of partner feedback, and found and fixed a failed-login lockout that had never fired in production, verified live.

Mobile & Platform Engineer (Contract), WellaPath *Mar 2026 – Present*

Lagos, Nigeria (Remote)

- Sole developer of the Flutter app for health workers and the public, shipping through reviewed pull requests with 1,400+ automated tests passing in CI.
- Built the tooling for the versioned clinical knowledge base and a 234-case validation bank; the latest run passed 230 of 231 graded cases with zero under-triage, after it caught and fixed a real under-triage case.
- Cut a seven-minute cold start on throttled 3G by redesigning boot as staged loading with backoff and hard per-attempt timeouts.
- Built wellapath.org with a build gate that blocks publishing until all 48 danger-sign labels are clinician-approved, plus banned-word linting and email or WhatsApp signups on Neon PostgreSQL.

Full-Stack Engineer, Century Cinemax Platform *Jul 2026 – Present*

Kampala, Uganda · two-person team

- Co-building a multi-tenant cinema platform: a Laravel 13 modular monolith with 17 bounded modules, PostgreSQL 16, Redis Horizon, Reverb and two Next.js apps. I own catalogue, scheduling, pricing, seating and booking.
- Built an offline-capable POS and ticket-scanner PWA on an IndexedDB outbox, and integrated URA EFRIS e-invoicing and Mobile Money callbacks through queued fan-out so a slow third party never blocks a sale.

Full-Stack Engineer (Contract), Vitorra Holdings Ltd *May 2026 – Present*

Kampala, Uganda

- Leading a full platform rebuild as sole engineer, migrating a legacy React/Firebase app to a Next.js 16, Laravel and PostgreSQL monorepo, after writing the requirements, system design and design-system spec.

Web Developer, Humble Vessel Foundation *May 2025 – Aug 2025*

Non-profit organisation

- Built the foundation's donation website, accepting SWIFT bank transfers and MTN and Airtel Money merchant payments, with an emailed payment guide for each donor and a confirmation email once their payment is received.

MOBILE APPS

WellaPath: clinical decision support *Flutter · Dart · Android & iOS*

- Built the app end to end as sole mobile engineer: a four-stage decision engine that runs entirely on the device, Dio networking and Hive storage, with no patient data ever transmitted.
- Boots from last-known-good config when the network fails; clinical content ships as versioned artifacts, so guidance updates without an app release. Builds in Google Play internal testing and TestFlight.

Okelcor Ops: operations companion app *React Native 0.86 · Expo 57 · EAS*

- Used by the operations team for orders, quotes, an email-style inbox and a revenue dashboard.
- 2FA with recovery codes, biometric app lock and tokens in the device secure store; push notifications that open the exact order or quote, with unread badge counts.
- Live chat over Crisp with Pusher realtime and a presence toggle; server state through TanStack Query; dark mode and quick actions.

Okelcor Partner: offline-first sales log *Android (TWA) · PWA · Next.js · IndexedDB*

- Replaced paper sales books for partners in Ghana and Nigeria on low-end Android phones. Sales save locally first and sync with client-generated IDs, so a retry on a dead connection never double-counts a sale.
- Cold-starts offline with phone + PIN auth; stores amounts in six currencies exactly as entered. Packaged for Google Play with Bubblewrap and Digital Asset Links, so a web deploy updates the app without a store release.

Kampala Pressure: mobile-first life game *React · TypeScript · personal project, in build*

- A content-driven decision engine where new stories ship as data, with balance simulations in the test suite that measure win rates per character instead of guessing difficulty.

SELECTED PROJECTS

- **Uganda HIE, Bank of Uganda BoU@60 Hackathon:** a national Health Information Exchange demo built solo, with 6 role-based portals, patient consent controls, break-glass emergency access and audit flagging.
- **Chicken Tonight:** an ordering prototype for a 15-outlet restaurant group, with MTN Mobile Money, a kitchen display system and live rider tracking.
- **Afro Zone Munich:** a nightclub site and admin system with a 5-step booking flow, Supabase Realtime and row-level security.
- **Healthy Steps Foundation** (healthystepsfoundation.org): a nonprofit site with a Supabase-backed donation flow and server-generated PDF receipts.
- **Takeover Creatives FC:** a headless CMS on Next.js and Laravel Filament with role-based access and a full test suite.

EDUCATION

BSc Networking & Cybersecurity, ISBAT University, Kampala · *Mar 2023 – Jun 2026*
Diploma in Cybersecurity, AltSchool Africa · *Oct 2024 – Nov 2025*

TECHNICAL SKILLS

Languages: TypeScript, Dart, PHP, JavaScript, SQL, Python (basic)

Frontend: Next.js 15/16, React 19, Tailwind CSS v4, Framer Motion, accessibility

Backend: Laravel 13 (Sanctum, Horizon, Reverb, Filament), Node.js (Fastify), REST and OpenAPI

Mobile: Flutter (Dart, Dio, Hive), React Native / Expo (EAS builds, push notifications, deep links, biometrics, SecureStore), Android TWA (Bubblewrap), Google Play Console, offline-first design

Data & Infra: PostgreSQL, Redis, Supabase, Neon, Docker, GitHub Actions, Vercel, AWS

Payments & Integrations: Stripe, Adyen, MTN Mobile Money, URA EFRIS, Pusher, Crisp, Resend

Security: OAuth 2.0 / JWT, RBAC, 2FA, row-level security, network security fundamentals
